SUBJECT: **TRAINING OF WASTE WATER TREATMENT OPERATORS**

Tom Cornwell and I have reviewed the work that will be covered when the new Anode Scrubber Blowdown Treatment System is operational.

On the premise that the work will essentially be done on day shift with monitoring done at night by area Maintenance personnel, we plan to post one more day shift Water Treatment Operator job to bring the total to three. We believe the work can be accomplished by a crew of two or three on days, taking days off and vacations into consideration. If it is found that an additional operator is needed, then a second posting can be made later.

We plan to make the posting on or about October 22, so there is time for discussion, if desired.

The primary duties of the Water Treatment Operators are to:

- 1) Operate the Billet Casting and Anode Casting Process Water Treatment plants including control of blowdown, operation of treatment equipment, operation of filters, handling of sludges, etc.
- 2) Maintain treatment and blowdown of the various plant cooling towers.
- 3) Monitor the plant lift stations and sewers.
- 4) Assist in any control sampling or monitoring of effluent that necessary.
- 5) Make minor repairs to the treatment equipment.
